

The Ultimate Transmission Protection!

For the best transmission fluid filtration, look to the EP NTZ TransProtector inline magnetic micro filter. The TransProtector removes the highest percentage of particles 15 micron and larger. The key? Our radially wound depth-type filter element, which is superior to pleated paper in fluid cleaning and in holding those particles.

Our cooler conditioning kit includes everything you need to install the TransProtector. It's all packed in a measuring/testing container that is an important tool in ensuring proper fluid flow – key in preventing transmission failures.

Your transmission will perform to the top of its capability, with longer lasting components and fluid.

TransProtector – the smart choice for ultimate protection!
